Annular dark-field imaging is a method of mapping samples in a scanning transmission electron microscope (STEM). These images are formed by collecting scattered electrons with an annular dark-field detector.. Conventional TEM dark-field imaging uses an objective aperture in order to only collect scattered electrons that pass through. In contrast, STEM dark-field imaging does not use an ...

Bright-field microscopy is the simplest of all the optical microscopy illumination techniques. Sample illumination is transmitted (i.e., illuminated from below and observed from above) white light, and contrast in the sample is caused by attenuation of the transmitted light in dense areas of the sample. Bright-field microscopy is the simplest of a range of techniques used for illumination of ...

Daniel Friedan, Professor II and a founding member of the New High Energy Theory Center (NHETC) has won the 2010 Lars Onsager Prize of the American Physical Society, one of the most prestigious prizes the APS awards. The citation reads: For seminal work on the classification and characterization of two-dimensional unitary conformal field theories of critical states

Visible light can be used to examine *C. elegans*, however, in general, bright field and phase-contrast microscopy offers little contrast- making cells and their major components difficult to see. DIC microscopy, however, allows high contrast images to be formed, and is ideal for examining nuclei, nucleoli, and granular structures within *C. elegans* cells (Sulston and Horvitz, 1977; Sulston et al ...
