Top 10 algorithms in data mining - UVM

When one has far more potentially predictive features than observations, standard penalty methods such as AIC and BIC fail. We have developed a set of Streamwise Feature Selection (SFS) methods which support interleaving the generation and selection of features. SFS excels when a huge number of ...

Papers by Keogh and collaborators that use SAX. (in random order) In [1] we show how to use SAX to find time series discords which are unusual time series. In [2] we consider a special case of SAX, which has an alphabet size of 2, and a word size equal to the raw data, and show that we can use this bit-level representation for a variety of data mining tasks.

Welcome to the SAX - University of California, Riverside

Charu Aggarwal . Biography Charu Aggarwal is a Distinguished Research Staff Member (DRSM) at the IBM T. J. Watson Research Center in Yorktown Heights, New York.

In data mining, anomaly detection (also outlier detection) is the identification of rare items, events or observations which raise suspicions by differing significantly from the majority of the data. Typically the anomalous items will translate to some kind of problem such as bank fraud, a structural defect, medical problems or errors in a text.. Anomalies are also referred to as outliers ...

Opinion mining (sometimes known as sentiment analysis or emotion AI) refers to the use of natural language processing, text analysis, computational linguistics, and biometrics to systematically identify, extract, quantify, and study affective states and subjective information. Sentiment analysis is widely applied to voice of the customer materials such as reviews and survey responses, online ...

L'exploration de données [notes 1], connue aussi sous l'expression de fouille de données, forage de données, prospection de données, data mining, ou encore extraction de connaissances à partir de données, a pour objet l'extraction d'un savoir ou d'une connaissance à partir de grandes quantités de données, par des méthodes automatiques ou semi-automatiques.

Training classifiers with datasets which suffer of imbalanced class distributions is an important problem in data mining. This issue occurs when the number of examples representing the class of interest is much lower than the ones of the other classes.

An insight into classification with imbalanced data

1.1. Streaming applications. Streaming applications impose unique constraints and challenges for machine learning models. These applications involve analyzing a continuous sequence of data occurring in real-time.

Unsupervised real-time anomaly detection for streaming data

5. Conclusion. Big data analytics which leverages legions of disparate, structured, and unstructured data sources is going to play a vital role in how healthcare is practiced in the future.

The vision of the Adaptive Intelligence Research (AIR) Group at Changwon National University is a "Making the Great! Making the New!"™. Our work ranges from basic research in computational linguistics to key applications in human language technology, and covers areas such as statistical machine translation, opinion mining, and probabilistic parsing and tagging.

Clustering algorithms are unsupervised methods for finding groups of similar points in data. They are closely related to statistical mixture models.
