GDB, the GNU Project debugger, allows you to see what is going on `inside' another program while it executes -- or what another program was doing at the moment it crashed. GDB can do four main kinds of things (plus other things in support of these) to help you catch bugs in the act: Start your ...

GDB: The GNU Project Debugger

Before you can get started, the program you want to debug has to be compiled with debugging information in it. This is so gdb can work out the variables, lines and functions being used. To do this, compile your program under gcc (or g++) with an extra '-g' option: Gdb is run from the shell with the ...

gdbserver is a computer program that makes it possible to remotely debug other programs. Running on the same system as the program to be debugged, it allows the GNU Debugger to connect from another system; that is, only the executable to be debugged needs to be resident on the target system ("target"), while the source code and a copy of the binary file to be debugged reside on the developer ...
