CHAPTER 8: ANALOG FILTERS SECTION 8.1: INTRODUCTION Filters are networks that process signals in a frequency-dependent manner. The basic concept of a filter can be explained by examining the frequency dependent nature of the impedance of capacitors and inductors. Consider a voltage divider where the shunt leg is a reactive impedance.

CHAPTER 8 ANALOG FILTERS

Analog and Digital Filter Design All analog filters are designed from a normalized lowpass model. This model is a set of component values that are normalized for a $\omega = 1$ rad/s at the passband edge. Passive filter models have component values that are normalized for a 1 Ω load.

The matched- z and direct substitution digital filter design techniques use the correspondence $z = e^{sT}$. s to map the poles and zeros of the analog filter to corresponding locations in the z plane. If the analog filter has a pole at $s = a$, the corresponding digital filter pole would be at $z = e^{aT}$.

IIR Filter Design IIR filters are directly related to analog filters (continuous time) via a mapping of $H(s)$ (CT) to $H(z)$ (DT) that preserves many properties Analog filter design is sophisticated signal processing research since 1940s Design IIR filters via analog prototype need to learn some CT filter design

ELEN E4810: Digital Signal Processing Topic 8: Filter

Filtering, whether intended or unintended, modifies the magnitude and phase of signal frequency components. Every analog or radio frequency (RF) circuit performs filtering on the signals passing through them. Therefore for RF or analog circuit designer, it is important to understand, how to design and construct filters.
