1.0 Principles of electrophoresis Electrophoresis is the process of moving charged molecules in solution by applying an electric field across the mixture (Fig 1.1). Because molecules in an electric field move with a speed dependent on their charge, shape, and size, electrophoresis has been extensively developed for molecular separations.

Preparation, loading and running of gel in electrophoresis. To prepare gel, agarose powder is mixed with electrophoresis buffer to the desired concentration, and heated in a microwave oven to melt it.

in zone electrophoresis are absorbent paper, gel of starch, agar and polyacrylamide. The presence of supporting media minimizes mixing of the sample and that makes the analysis and purification of the molecule from the gel much easier than the moving boundary electrophoresis. The gel electrophoresis is the best example of zone electrophoresis.

As with antibiotics, electrophoresis is useful in both the creation and production of vaccines. The purpose of a vaccine is to help the body generate antibodies to a potentially dangerous pathogen, and electrophoresis is a useful method for detecting those antibodies.
